

ECHO

Network Connection Management

Introducing ECHO

Echo is a user-friendly solution that provides secure and streamlined network access for client devices. It also allows AirPlay and Chromecast-enabled devices to be assigned to specific users, ensuring that only authorized users can see and cast to selected streaming devices.

Features

Manage user access
and device registration

Manage AirPlay and
Chromecast visibility

No unauthorized use of
higher-priority
networks

Privacy-safe access
using pre-approved
codes

Clear overview of all
registered devices per
network segment

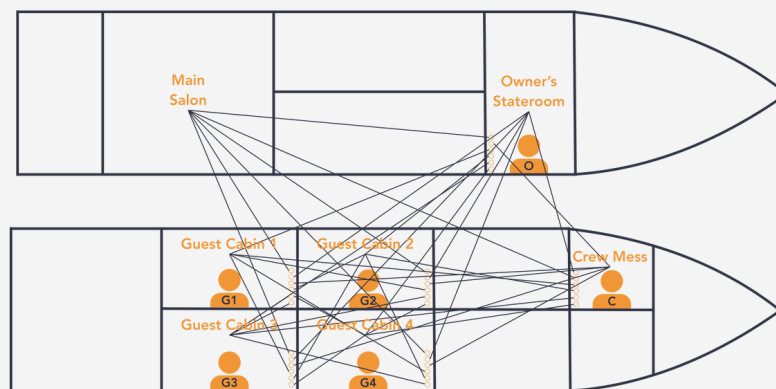

Unregistered devices
are unable to gain
access, even with a Wi-
Fi password

Without ECHO

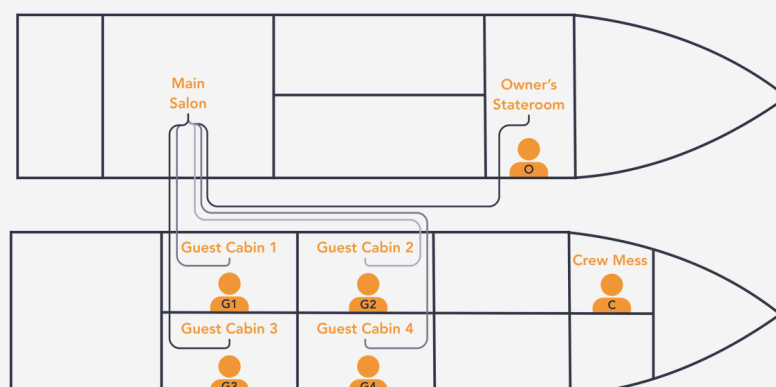

All users can see all streaming devices throughout the entire yacht. A Guest can stream to the Owner's Stateroom. On their phone, Guests and Owners will be confused by seeing all AirPlay and Chromecast devices throughout the yacht.

With ECHO

All users will only see the Airplay and/or Chromecast areas they need. A guest can stream to his/her cabin and public areas.

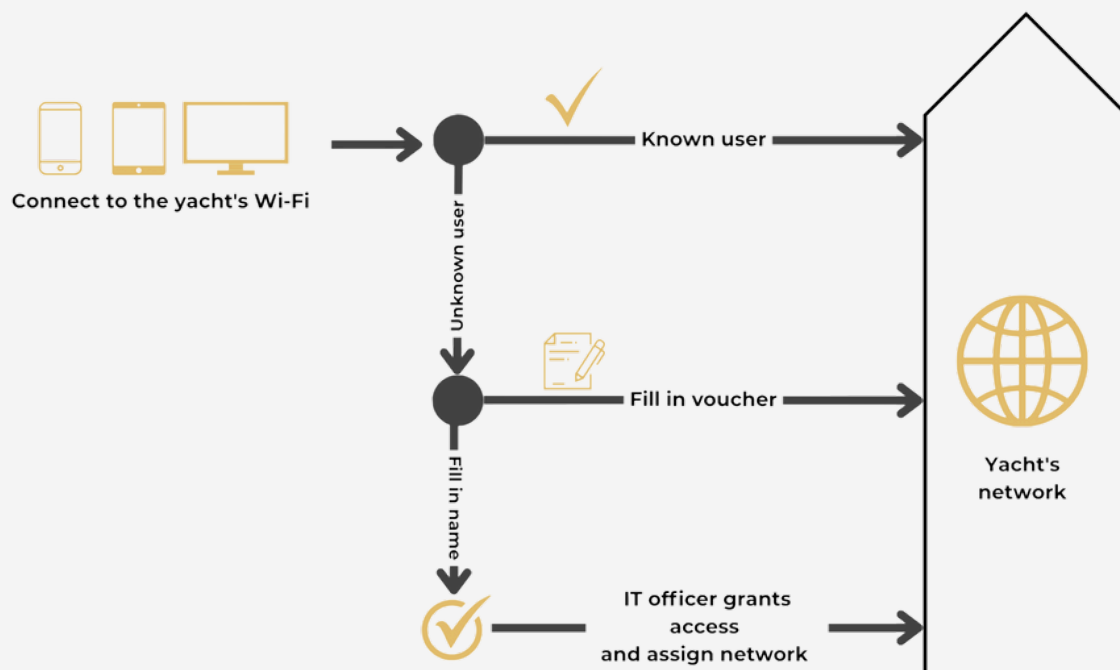

The Owner can stream to the Owner's Stateroom, Owner's Office, and public areas, without the confusion of seeing all Airplay and Chromecast areas on their phone.

Secure & Flexible Network Access for Every User

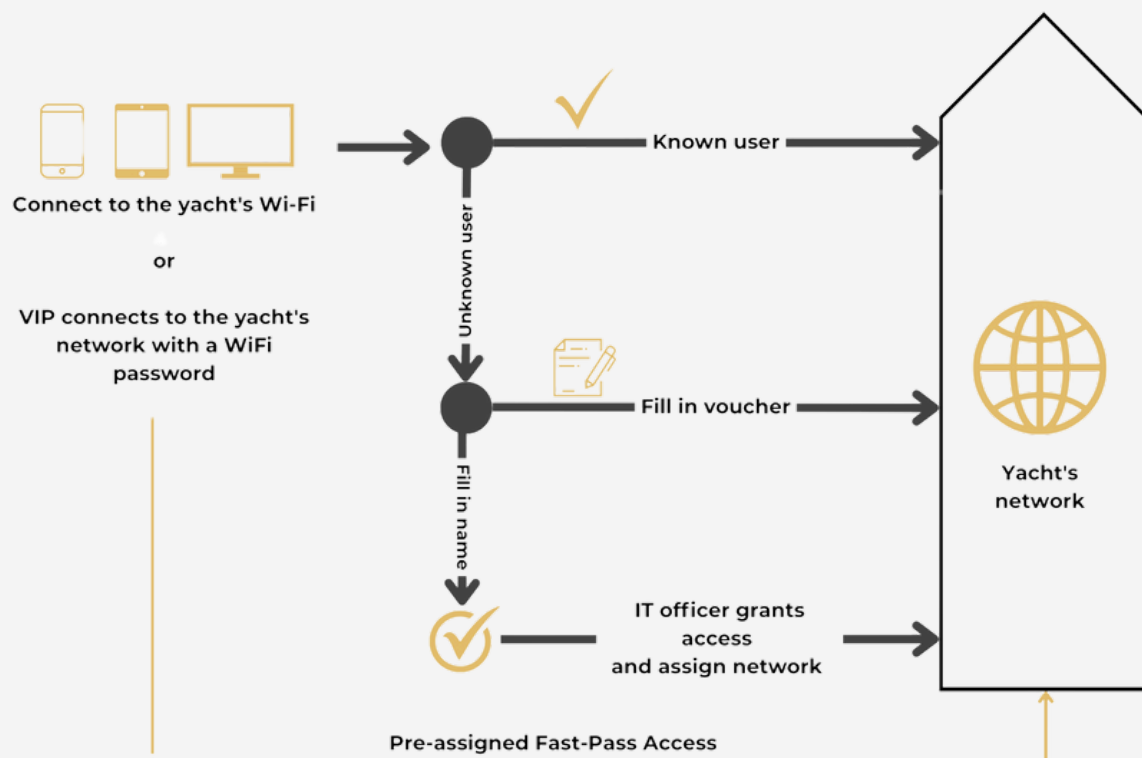

Our smart network access system ensures secure, flexible onboard connectivity. Knowing the Wi-Fi password alone doesn't grant access to high-priority networks, which are restricted. Guests and temporary workers can log in via a registration portal or a time-sensitive voucher. Crew devices can be easily removed or blocked when they depart, without having to change the Wi-Fi code.

Fast Pass Feature

Streamline the onboarding process for owners and guests with the Fast Pass feature. It provides instant WiFi access through a direct password, automatically connecting them to a pre-configured network and equipment, visible only to them. This eliminates the need for manual voucher completion and the registration process.
